

R Practice 3 - Plotting in ggplot

Point72

January 15, 2017

1. Begin by reading in the “Executives.csv” file. Convert the ID and the EXECID columns to factors since they are categories and not numbers.
2. Create a scatterplot that shows the relationship between salary and bonus. Add custom titles and axis labels to this plot. Next, create a single scatter plot that shows this same trend for male and female execs.
3. Create a new column called totalComp that is the sum of the salary, bonus and other columns. Create a boxplot that compares the distribution of the total compensation between male and female execs. Find a way (facet wrap) to look at this comparison across the four regions. I want a series of boxplots comparing the distribution of the total compensation of male and female execs across the four regions.
